Factoring Trinomials.
Factoring trinomials is probably the most common type of factoring in Algebra. In this lesson, we will factor trinomials that have a lead coefficient of 1. To begin this lesson, it is important for you to understand the process of multiplying

Download Free Algebra 1

binomials using the FOIL method. Please be sure to review that lesson before starting this lesson.

Correct answer:

$$\frac{\{x+3\}}{\{2x\}}$$

Explanation: By

Download Free Algebra 1

factoring both the numerator and the denominator we get the following:

$$\frac{(x+1)(x-1)(x+3)}{(x+1)(x-1)^2x}$$

If we simplify we get:

$$\frac{x+3}{2x}$$

Solve the quadratic
equation $x^2 + 4x + 3 = 0$. The roots are $x_1 = ?$, $x_2 = ?$ (use
the quadratic equation
calculator to see the
steps). Therefore, x_2

Download Free Algebra 1

$$+ 4x + 3 = 1(x + 1)(x + 3).$$
$$(x^2 + 4x + 3)$$
$$= 1(x + 1)(x + 3)$$

Rewrite: $1(x + 1)(x + 3) = (x + 1)(x + 3)$

Thus, $x^2 + 4x + 3 = (x + 1)(x + 3)$.

Factoring Polynomials Calculator - eMathHelp

Since the product is positive (18) and the sum is positive (9),

Download Free Algebra 1

you need both factors to be positive. Make a list of the possible factor pairs with a product of 18, and then find the one with a sum of 9. The factors 3 and 6 have a sum of 9. So, replace the quadratic's. and then factor by grouping.

*polynomials (Algebra
1 practice)*

In factoring the general trinomial, begin with the factors of 12. These include the following: 1, 12, 2, 6, 3, 4. As a general rule, the set of factors closest together on a number line should be tried first as possible factors for the trinomial. The only

Download Free Algebra 1

Factors of the last term of the trinomial are 1 and 3, so there are not other choices to try. Because the last term is negative the signs of the factors 1 and 3 must be opposite.

*Factoring Polynomials
- AlgebraLAB*

Multiplying $(ax + 2y)$
 $(3 + a)$, we get the

Download Free Algebra 1

Factoring expression

$$3ax + 6y + a^2x + 2ay$$

and see that the

factoring is correct.

This is an example of factoring by grouping since we "grouped" the terms two at a time. Multiply $(x - y)(a + 2)$ and see if you get the original expression. Again, multiply as a check.
