Some of the bacterial diseases are Syphilis, Pneumonia, Tetanus, and Tuberculosis. Examples of diseases caused by a virus are Chickenpox, Small Pox, Measles, Polio. Fungal infections include Ringworm infection, Athlete's foot, Yeast infections etc. Malaria is a disease caused by an organism belonging to Protista. Diseases caused by helminths include Ascariasis, Taeniasis etc.

~~Types of Diseases: Classification of Diseases with ...~~

Organisms that spread disease, rather than causing it themselves, are called vectors. The mosquito is the vector for malaria. It is important to understand the life cycle of a pathogen and the way in which vectors spread the pathogen. This knowledge gives scientists ideas about how the spread of a disease might be controlled.

Organisms that are normal flora can occasionally cause disease, especially when defenses are disrupted. Tropisms (attractions to certain tissues) determine which body sites microorganisms colonize. Normal flora is influenced by tropisms and many other factors (eg, diet, hygiene, sanitary conditions, air pollution).

Biology of Disease is concerned with the scientific study of disease, and is one of the foundations of medical science and practice. It encompasses all aspects of disease, including knowledge of the causes and effects of disease, and the organism's response to disease. The cause of a disease is often an injurious agent, but defects and deficiencies may also cause disease.
