Transparency as well as fault?tolerance file access are the highlights of our system design. To fulfil these requirements, we incorporate the idea of directory?oriented replication and extended prefix tables in the system design. The implementation consists of a command shell, a DOS manager, and a recovery manager.

We have designed and implemented two new filesystems that are included in the standard Linux kernel. These filesystems, called ``Extended File System'' (Ext fs) and ``Second Extended File System'' (Ext2 fs) raise the limitations and add new features. In this paper, we describe the history of Linux filesystems.

Design and Implementation of the Second Extended Filesystem

File system design is governed by two general forces: technology, which provides a set of basic building blocks, and workload, which determines a set of operations that must be carried out efficiently. This section summarizes technology changes that are underway and describes their impact on file system design.

System design is the phase that bridges the gap between problem domain and the existing system in a manageable way. This phase focuses on the solution domain, i.e. "how to implement?" It is the phase where the SRS document is converted into a format that can be implemented and decides how the system will operate.

These are covered in operating system design and implementation. Operating System Design Goals It is quite complicated to define all the goals and specifications of the operating system while designing it. The design changes depending on the type of the operating system i.e if it is batch system, time shared system, single user system, multi user system, distributed system etc.
