Sustainable design is booming, but the men and women dedicated to reducing their carbon impact have lost sight of what they are trying to save: the natural world. Author Neil Chambers has been at the forefront of cutting-edge, sustainable architecture for years, and Urban Green is his revolutionary vision for bringing the power of the conservation and design movements together. He advocates looking to nature for the missing components of the green revolution: oysters that can clean water at up to 5 liters an hour; beavers that reshape their environments while simultaneously enriching ecosystems; and mountains that offer a new way of imagining how a city could be built. By designing our homes and cities in harmony with the natural world, we can take the next step in the sustainable revolution.

Author Page Keeley continues to provide KOC012 teachers with her highly usable and popular formula for uncovering and addressing the preconceptions that students bring to the classroom. In this first book devoted exclusively to life science in her Uncovering Student Ideas in Science series, Keeley addresses the topics of life and its diversity; structure and function; life processes and needs of living things; ecosystems and change; reproduction, life cycles, and heredity; and human biology."

A synthesis of research and theory, this work chronicles the dawn of a new era in which the adaptability and autonomy of living organisms becomes the model for human made systems and machines. The author combines ideas from the Chaos Theory, cybernetics, current thinking on evolution and research into computerized artificial life with his own experience of on-line culture to show that industrial culture is now obsolete. This book presents the prospects of imminent revolution as Kelly identifies new frontiers of thinking about biological systems that will change the way the natural world is perceived.

A potent new book examines the overlap between our ecological crisis and video games. Video games may be fun and immersive diversions from daily life, but can they go beyond the realm of entertainment to do something serious—like help us save the planet? As one of the signature issues of the twenty-first century, ecological deterioration is seemingly everywhere, but it is rarely considered via the realm of interactive digital play. In *Playing Nature*, Alenda Y. Chang offers groundbreaking methods for exploring this vital overlap. Arguing that games need to be understood as part of a cultural response to the growing ecological crisis, *Playing Nature* seeds conversations around key environmental science concepts and terms. Chang suggests several ways to rethink existing game taxonomies and theories of agency while revealing surprising fundamental similarities between game play and scientific work. Gracefully reconciling new media theory with environmental criticism, *Playing Nature* examines an exciting range of games and related art forms, including historical and contemporary analog and digital games, alternate- and augmented-reality games, museum exhibitions, film, and science fiction. Chang puts her surprising ideas into conversation with leading media studies and environmental humanities scholars like Alexander Galloway, Donna Haraway, and Ursula Heise, ultimately exploring manifold ecological futures—not all of them dystopian.
