In this book, Nigeria, the most populous country in Africa and a region in the lowest income group per capita, is used to demonstrate the potential for healthcare reorganization and collaboration with the introduction of “ successful ” technologies centered around available, bio-compatible, and sustainable natural resources. Our book discusses three of the top killers of children under 5 years of age in Nigeria, pneumonia (20%), diarrheal diseases (15%), and traumatic injuries (4%). These conditions are used as examples to demonstrate the potential for improved pediatric outcomes with treatments engineered from sustainable and natural resources. Furthermore, this book outlines possible action items that can help drive economic growth, educational opportunities, collaborative outreach, and workforce productivity to build a healthy and sustainable community. Medical technology in the industrialized world has seen rapid advancements leading to increased survival and greater patient outcomes. However, the development and implementation of these resources is not always applicable to regions in need of new and more basic ways to provide treatment. Moore ’ s Law, a paradigm that considers advancement synonymous with increased digitization and optimization of electronic processes, defines the history of technology. However, the functionality of advanced and “ smart ” technology is essentially useless in underdeveloped areas. These regions lack some of the basic requirements for innovative medical technologies to impact human health, such as electricity, access to spare parts, computer analysis tools, and network architecture. In addition, the

poor physical infrastructure, insufficient management, and lack of technical culture are barriers for entry and sustainability of these technologies. Rather than importing medical devices from industrialized countries, we propose that the mindset and research focus for under developed areas must be on “ successful ” technologies. Simply put, these areas need technology that “ gets the job done. ”

Healthcare issues today encompass a wide range of increasing concerns: availability, affordability, effective and safe procedures, the needs of children, and quality of life. Organizations, individuals, and the government are all seeking ways to solve the healthcare crisis. In *Healthcare Solutions with Acupuncture*, author and doctor of oriental medicine Gary Fleischman presents one possible solution in the form of acupuncture a procedure involving the minimally invasive use of needles. For thousands of years, the Chinese have employed acupuncture applications to remedy health problems. Fleischman maintains these same procedures can be used to treat minor and major illnesses and could result in a tremendous reduction in healthcare costs in the United States. *Healthcare Solutions with Acupuncture* compares Chinese and Western medicine and reviews conditions and treatment options that can be used to successfully heal everything from abscesses to weight gain. *Healthcare Solutions with Acupuncture* provides easy-to-understand classifications of sicknesses, techniques of needling, and the healing process. A full practice of medicine that evaluates disease and treats the sick based on thousands of years of advancements, acupuncture methods offer effective therapies while containing costs.

The rapid growth of home health care has raised many unsolved issues and will have consequences that are far too broad for any one group to analyze in their entirety. Yet a major influence on the safety, quality, and effectiveness of home health care will be the set of issues encompassed by the field of human factors research--the discipline of applying what is known about human capabilities and limitations to the design of products, processes, systems, and work environments. To address these challenges, the National Research Council began a multidisciplinary study to examine a diverse range of behavioral and human factors issues resulting from the increasing migration of medical devices, technologies, and care practices into the home. Its goal is to lay the groundwork for a thorough integration of human factors research with the design and implementation of home health care devices, technologies, and practices. On October 1 and 2, 2009, a group of human factors and other experts met to consider a diverse range of behavioral and human factors issues associated with the increasing migration of medical devices, technologies, and care practices into the home. This book is a summary of that workshop, representing the culmination of the first phase of the study.
