MOCVD (Metal-Organic Chemical Vapor Deposition) is a technology used to deposit ultra-thin, single-crystal layers onto a semiconductor wafer. MOCVD is the most important manufacturing process for III-V compound semiconductors, especially those based on gallium nitride (GaN). In the MOCVD process, a gas stream is passed over a heated wafer (typically at temperatures between 400 °C - 1300 °C depending on the material to be deposited).
