Unit 6 Quiz--Ionic and Net Ionic Reactions

net ionic: $NH_3(g) + H^+(aq) \rightarrow NH_4^+(aq)$ If the ammonia was an aqueous solution, the net ionic would be this: $NH_3(aq) + H^+(aq) \rightarrow NH_4^+(aq)$ The only thing I changed was (g) to (aq). Another possibility is this: $NH_3(g) + HCl(g) \rightarrow NH_4Cl(s)$ The above reaction does not take place in solution.

The first step in writing a net ionic equation is identifying the ionic compounds of the reaction. Ionic compounds are those that will ionize in an aqueous solution and have a charge. Molecular compounds are compounds that never have a charge. They are made between two non-metals and are sometimes referred to as covalent compounds.

Answer Key to Practice Problems on Net Ionic Equations:

Molecular and Ionic Equations . When ionic compounds are dissolved into water, the polar water molecules break apart the solid crystal lattice, resulting in the hydrated ions being evenly distributed through the water. This process is called dissociation and is the reason that all ionic compounds are strong electrolytes.
