☐A compellingly drawn dystopian future.☐ ☐BCCB The Maze Runner meets The Hunger Games in this heart-pounding trilogy☐now in paperback. Orphaned teens, soon to be hunted for sport, must flee their resettlement camps in their fight for survival and a better life. For in the Republic of the True America, it's always hunting season. Riveting action, intense romance, and gripping emotion make this fast-paced adventure a standout debut. After a radiation blast burned most of the Earth to a crisp, the new government established settlement camps for the survivors. At the camp, sixteen-year-old "LTs" are eager to graduate as part of the Rite. Until they learn the dark truth: LT doesn't stand for lieutenant but for Less Thans, feared by society and raised to be hunted for sport. They escape and join forces with the Sisters, twin girls who've suffered their own haunting fate. Together they seek the fabled New Territory, with sadistic hunters hot on their trail. Secrets are revealed, allegiances are made, and lives are at stake. As unlikely Book and fearless Hope lead their quest for freedom, these teens must find the best in themselves to fight the worst in their enemies. Catch the rest of the series in The Capture and The Release!

The Behavior and Ecology of Pacific Salmon and Trout explains the patterns of mate choice, the competition for nest sites, and the fate of the salmon after their death. It describes the lives of offspring during the months they spend incubating in gravel, growing in fresh water, and migrating out to sea to mature. This thorough, up-to-date survey should be on the shelf of everyone with a professional or personal

interest in Pacific salmon and trout. Written in a technically accurate but engaging style, it will appeal to a wide range of readers, including students, anglers, biologists, conservationists, legislators, and armchair naturalists.

Closed life-cycle breeding of aquaculture species is essential for sustainability. The primary bottleneck towards this goal is a robust commercial-scale hatchery technology. The larval phase of Palinurid lobsters is amongst the lengthiest of any marine invertebrates; hence a major leap forward in aquaculture hatchery technology is required for commercial-scale production. The main challenges for Palinurid hatchery technology development are outlined together including aspects of water quality and tank design. The larval biology of Palinurid lobsters is discussed as well as broodstock husbandry and spawning. A concise review of reported diseases is presented together with larval nutrition requirements and their relationship to final larval metamorphosis to juvenile.

Aquaculture is the fastest-growing food production sector in the world. With demand for seafood increasing at astonishing rates, the optimization of production methods is vital. One of the primary restrictions to continued growth is the supply of juveniles from hatcheries. Addressing these constraints, *Advances in aquaculture hatchery technology* provides a comprehensive, systematic guide to the use of current and emerging technologies in enhancing hatchery production. Part one reviews reproduction and larval rearing. Aquaculture hatchery water supply and treatment systems, principles of finfish broodstock management, genome preservation, and varied aspects of nutrition and feeding are discussed in addition to larval health management and microbial management for bacterial pathogen control. Closing the life-cycle and overcoming challenges in hatchery production for selected invertebrate species are the focus of part two, and advances in hatchery technology for spiny lobsters, shrimp, blue mussel, sea cucumbers and cephalopods are all discussed. Part three concentrates on challenges and successes in closing the life-cycle and hatchery production for selected fish species, including tuna, striped catfish, meagre, and yellowtail kingfish. Finally, part four explores aquaculture hatcheries for conservation and education. With its distinguished editors and international team of expert contributors, *Advances in aquaculture hatchery technology* is an authoritative review of the field for hatchery operators, scientists, marine conservators and educators. Provides a comprehensive guide to the use of technologies in enhancing hatchery production Examines reproduction and larval rearing, including genetic improvement and microdiets Discusses challenges in hatchery production of specific species
