Following are the main operations of transaction: Read(X): Read operation is used to read the value of X from the database and stores it in a buffer in main memory. Write(X): Write operation is used to write the value back to the database from the buffer. Let's take an example to debit transaction from an account which consists of following

DBMS Transaction Processing Concept - javatpoint

Description. Transaction processing is designed to maintain a system's Integrity (typically a database or some modern filesystems) in a known, consistent state, by ensuring that interdependent operations on the system are either all completed successfully or all canceled successfully.. For example, consider a typical banking transaction that involves moving \$700 from a customer's savings ...

Transaction Processing (□□)

The transaction concept emerges with the following properties: Consistency: the transaction must obey legal protocols. Atomicity: it either happens or it does not; either all are bound by the contract or none
